fullPage.js And Advanced Custom Fields Integration

Yusuf Mudagal 29 Dec 2022 Updated 7 Aug 2026 3 min read

Welcome to our blog post on integrating FullPage.js with Advanced Custom Fields (ACF) !

FullPage.js is a popular JavaScript library that allows developers to create full screen scrolling websites with ease. It provides a simple and intuitive interface for creating horizontal and vertical scrolling pages, as well as a variety of customization options for fine-tuning the appearance and behavior of your site.

ACF is a powerful plugin for WordPress that allows users to easily add custom fields to their posts and pages. This can be useful for adding additional content, such as images, videos, or maps, to a page without having to write custom code.

By combining FullPage.js and ACF, you can create dynamic, interactive scrolling websites that are easy to update and maintain. In this tutorial, we will show you how to integrate FullPage.js with ACF in a few simple steps.

Install FullPage.js and ACF

First, you will need to install both FullPage.js and ACF on your WordPress website. You can either download these plugins from the WordPress plugin repository or install them directly from the WordPress dashboard.

Create Custom Fields

Once you have installed ACF, you can create custom fields for your posts and pages by going to the Custom Fields menu in the WordPress dashboard. Here, you can add text, images, or other types of content to your pages using a variety of field types.

Add FullPage.js to Your Website

To add FullPage.js to your website, you will need to include the FullPage.js library in your theme’s header.php file. You can either download the library from the FullPage.js website or link to it directly from a CDN.

Integrate FullPage.js and ACF

To integrate FullPage.js and ACF, you will need to use the ACF functions provided by the plugin to retrieve the custom field data and pass it to FullPage.js. You can do this by creating a custom function in your theme’s functions.php file, or by using a plugin such as ACF to JSON.

Customize Your FullPage.js Implementation

Finally, you can customize the appearance and behavior of your FullPage.js implementation using the various options provided by the library. You can choose to enable or disable horizontal or vertical scrolling, add animations, or customize the appearance of your pages using CSS.

In conclusion, integrating FullPage.js with Advanced Custom Fields can be a great way to create dynamic, interactive scrolling websites that are easy to update and maintain. With a little bit of knowledge and some simple steps, you can easily add FullPage.js to your WordPress website and start creating engaging, full screen scrolling pages in no time.
