How often is WordPress updated and how do you run updates in WordPress?

Yusuf Mudagal 23 Dec 2022 Updated 7 Aug 2026 3 min read

WordPress is a popular content management system (CMS) that is constantly being updated with new features, security fixes, and improvements. As a WordPress user, it is important to keep your site up to date to ensure that it is running smoothly, securely, and with the latest features.

So, how often is WordPress updated?

WordPress typically releases new versions of the software every few months, with major updates being released once or twice a year. These updates can include new features, security fixes, and performance improvements.

Minor updates, which are released more frequently, typically include security fixes and performance improvements. These updates are important to install as they help to keep your site secure and running smoothly.

Major updates, on the other hand, can introduce new features and make significant changes to the way WordPress works. These updates are usually released once or twice a year and are usually accompanied by an update to the WordPress theme and plugin APIs.

How do you run updates in WordPress?

Running updates in WordPress is a straightforward process. Here are the steps to follow:

1. Back up your site: Before updating WordPress, it is important to back up your site in case anything goes wrong. This will allow you to restore your site to its previous state if anything goes wrong during the update process.
2. Check for updates: To check for updates, log in to your WordPress dashboard and go to the Updates screen. If there are any updates available, you will see a notification at the top of the screen.
3. Install updates: To install updates, simply click the “Update Now” button. WordPress will handle the rest of the process automatically, including downloading and installing the updates.
4. Test your site: After updating WordPress, it is important to test your site to make sure everything is working as expected. This includes checking your theme and plugins to make sure they are compatible with the new version of WordPress.

If you are using a managed WordPress hosting provider, such as CodeTrappers, they may handle the updates for you. In this case, you will typically receive notifications when updates are available and can simply click a button to install them.

In conclusion, it is important to keep your WordPress site up to date to ensure that it is running smoothly, securely, and with the latest features. Minor updates are released frequently and include security fixes and performance improvements, while major updates are released once or twice a year and can introduce new features and make significant changes to the way WordPress works. Running updates in WordPress is a straightforward process and can be done through the WordPress dashboard or with the help of a managed WordPress hosting provider.
