WordPress Database Backup: 3 Methods to Backup your WP Database

Yusuf Mudagal 22 Dec 2022 Updated 7 Aug 2026 3 min read

WordPress is a popular content management system (CMS) used by millions of websites around the world. It's user-friendly and easy to customize, making it a go-to choice for many small businesses and bloggers. However, like any other CMS, it's important to regularly backup your WordPress database to prevent data loss in case of a technical issue or hack.

At CodeTrappers, we understand the importance of keeping your WordPress website safe and secure. That's why we've compiled a list of three methods you can use to backup your WP database.

Method 1: Use a WordPress Plugin

One of the easiest ways to backup your WordPress database is to use a plugin. There are several WordPress plugins available that allow you to schedule automatic backups (https://codetrappers.com/maintenance-for-wordpress/) of your database and files. Some popular options include:

- WP-DB-Backup: This plugin allows you to schedule automatic backups and store them in a location of your choice, such as your email or a cloud storage service like Google Drive.
- UpdraftPlus: UpdraftPlus is a popular plugin that offers both free and premium versions. It allows you to schedule automatic backups and store them in a variety of locations, including your email, cloud storage, or even a remote server.

Method 2: Use cPanel or phpMyAdmin

If you're comfortable with technical tasks, you can also use cPanel or phpMyAdmin to backup your WordPress database. Both cPanel and phpMyAdmin are tools that allow you to manage your website's database and files. Here's how you can use them to backup your WP database:

- cPanel: Most hosting providers offer cPanel as a control panel for managing your website. To use cPanel to backup your WordPress database, log in to your cPanel account and navigate to the "Backups" section. From there, you can select the database you want to backup and choose a location to save the backup file.
- phpMyAdmin: If your hosting provider doesn't offer cPanel, you can use phpMyAdmin to backup your WordPress database. To do this, log in to your hosting account and navigate to the "Databases" section. From there, you can select the database you want to backup and click the "Export" button. You can then choose a location to save the backup file.

Method 3: Use the Command Line

If you're comfortable with the command line, you can use it to backup your WordPress database. To do this, you'll need to log in to your hosting account via SSH and run a few commands. Here's the basic process:

1. Log in to your hosting account via SSH.
2. Navigate to the directory where your WordPress files are stored.
3. Run the following command to create a backup of your WordPress database:

```
mysqldump -u [username] -p[password] [database_name] > [backup_file_name].sql
```

Replace [username] with your database username, [password] with your database password, [database_name] with the name of your WordPress database, and [backup_file_name] with the name you want to give the backup file.

Once you run this command, your WordPress database will be backed up to a file with the name you specified. You can then move this file to a safe location for storage.

In conclusion, it's important to regularly backup your WordPress database to prevent data loss. There are several methods you can use to do this, including using a WordPress plugin, cPanel or php
