Problem: A slow WordPress website can be caused by:

- **Unoptimized images** – Large files increase load time.
- **Too many plugins** – Excess plugins slow down site performance.
- **Slow hosting provider** – Shared hosting can limit speed.
- **Lack of caching** – Dynamic content loads slower without caching.

Solution:

- Use **image compression tools** like TinyPNG or WebP.
- Deactivate unnecessary plugins and use only essential ones.
- Upgrade to a **fast hosting provider** like Kinsta or Cloudways.
- Enable **caching plugins** such as WP Rocket or LiteSpeed Cache.

Following these steps will **significantly improve website speed and user experience**.
