Green Core Web Vitals, whatever the site runs on

LCP, INP and CLS fixed on Shopify, Webflow, Next.js, Laravel and Magento sites. Measured against real user data, with the before and after in writing.

Shopify, Webflow, Next.js, Laravel, Magento or plain HTML. We measure LCP, INP and CLS against real user data, fix what is actually costing you, and hand back the before and after. The WordPress version of this service has its own page.

- 300+ migrations, zero data loss
- Core Web Vitals in the green
- 24/7 emergency cover

What you get

Inside Core Web Vitals Optimization

Get in touch (https://codetrappers.com/contact/)

Field data first

We start from the Chrome UX Report and your own analytics, not a lab score. A page can pass Lighthouse and still fail for the visitors who matter.

Largest Contentful Paint

Hero images, fonts and render-blocking scripts sized, preloaded or deferred so the main thing on the page arrives first.

Interaction to Next Paint

Long tasks broken up, third-party scripts moved off the main thread, hydration trimmed. This is where most non-WordPress stacks lose.

Cumulative Layout Shift

Reserved space for images, ads and embeds, font fallbacks that match, and no late-loading banners pushing content around.

Edge and caching

Cloudflare, Fastly or the platform CDN configured for cache hits on the pages people land on, with image transforms and compression at the edge.

The service

How it works on each platform

The metrics are the same everywhere. What we can touch is not, so the plan is different for each.

Shopify

Theme code, app script audit, Liquid rendering and image sizing. Most Shopify slowness is apps, and we show you which ones.

Webflow

Interactions, embedded scripts, asset sizes and the settings Webflow does expose. Honest about the ceiling where it does not.

Next.js and React

Bundle analysis, server components, image and font optimisation, hydration cost and third-party loading strategy.

Laravel and custom PHP

Query profiling, response caching, asset pipeline, queue offloading and server tuning. We read the code, not just the waterfall.

Magento and other commerce

Full-page cache, catalogue queries, checkout scripts and the extensions nobody remembers installing.

Static and headless

Build output, CDN rules, image pipeline and the client-side JavaScript that static sites quietly accumulate.

Why CodeTrappers

Measured, then measured again

Speed work without a baseline is an opinion.

Before and after, in writing

Field and lab numbers for the pages that matter, taken before we start and after we finish, in a report you keep.

Fixes, not a plugin

We change code, configuration and assets. Nothing on this page is a caching plugin with a monthly fee.

The same engineers as the WordPress work

The team behind our WordPress speed service, which has kept client sites in the green through several metric changes.

Where it goes next

Monitoring

Alerts when a metric slips out of the green after a deploy, so the regression is caught the week it happens.

Performance budgets

Limits on bundle size and third-party weight, enforced in the build, so the site does not drift back.

Migration, if the platform is the ceiling

Sometimes the stack cannot get there. We say so, and we can move it if you decide to.

Questions

What people ask before they start

Something not covered here? Ask us directly and an engineer will answer.

Ask a question (https://codetrappers.com/contact/)

No. Core Web Vitals are a browser measurement, not a CMS feature. We work on Shopify, Webflow, Next.js, Laravel and Magento sites as well, and the WordPress version of this service has its own page.

The thresholds Google publishes: LCP under 2.5 seconds, INP under 200 milliseconds, CLS under 0.1, measured at the 75th percentile of real visitors. Lab scores are useful for debugging but are not the target.

Usually. Most Shopify slowness comes from apps injecting scripts and oversized images, both of which we can change. Where the platform itself is the limit we tell you before you pay for the attempt.

A fixed price for the audit and a fixed price for the fixes, agreed before work starts. Ongoing monitoring is optional and monthly.
